

FEATURES

- Low Supply Current 1mA Max
- Slew Rate 0.25V/ μ s Min
- Single Supply Operation +5V to +30V
- Low Input Offset Voltage 500 μ V Typ
- Low Input Offset Voltage Drift 10 μ V/ $^{\circ}$ C Max
- High Common-Mode Input Range ... V₋ to V₊ (-1.5V)
- High CMRR 100dB Typ
- High Open-Loop Gain 400V/mV Typ
- Single-Chip Monolithic Construction
- Pin Compatible With LM124, LM324, LM148, and OP-11
- Available in Die Form

GENERAL DESCRIPTION

The OP-421 quad low-power operational amplifier is a single-chip quad patterned after the OP-21 single operational amplifier. The PNP input stage allows the input common-mode voltage to include V₋. Featuring a low power-supply current (150 μ A/section typical at 5V), the OP-421 offers a unique solution for designs requiring a combination of high function density, wide bandwidth, and low-power operation. Applications for the OP-421 include low-power active filters, battery-operated remote line filters, and signal preconditioning amplifiers. In addition, the ever-present problem of crossover distortion in low-power devices is eliminated by a unique double-buffered output section.

NOTE:

Electrical tests are performed at wafer probe to the limits shown. Due to variations in assembly methods and normal yield loss, yield after packaging is not guaranteed for standard product dice. Consult factory to negotiate specifications based on dice lot qualification through sample lot assembly and testing.
